```

Divided into:

- intrinsic resistance
- exceptional phenotypes
- interpretive rules.

Importance of these rules is to ensure:

- accurate identification/ AST
- <u>clinically relevant</u> use of agents

Version 3...on its way!

Consultation on proposals for a new version (v3) of EUCAST Expert Rules

Intrinsic Resistance and Exceptional Phenotypes Tables

EUCAST Expert Rules version 2.0 was published on 29 October 2011(http://www.eucast.org/expert_rules). The rules are currently under review and proposals for changes to the intrinsic resistance and exceptional phenotypes tables are presented here with a summary of changes and the revised tables 1-7.

The proposals are open for comment by 3rd December 2015. Please send comments, with supporting data or references where appropriate, to the EUCAST Scientific Secretary (derek.brown222@btinternet.com).

Please use the attached form for your comments.

Surveillance implications

- 1. Intrinsic rules are not an issue...perhaps could serve as a monitoring tool.
- 2. Interpretive rules will have an impact on surveillance data.
 - ➤ ß-lactam reporting are key areas relevant to our current surveillance data:
 - 1. ESBL/AmpC reporting
 - 2. CRE reporting

ESBL

EUCAST position

If isolate is an ESBL and is susceptible to amoxicillinclavulanic acid or piperacillin-tazobactam then should be <u>reported as tested*</u>

Using EUCAST breakpoints for *Enterobacteriaceae* the susceptibility of 3rd and 4th generation cephalosporins should be **reported as tested***

ESBL – the nuts and bolts

- 1. ESBL = Bush-Jacoby 2be
- 2. By definition "increased hydrolysis of oxyimino-ß-lactams (cefotaxime; ceftriaxone; ceftazidime; cefepime; aztreonam).
- 3. Inhibited by clavulanic acid and/or tazobactam
- 4. TEM/SHV/CTX-M: have different affinities for different antimicrobials.

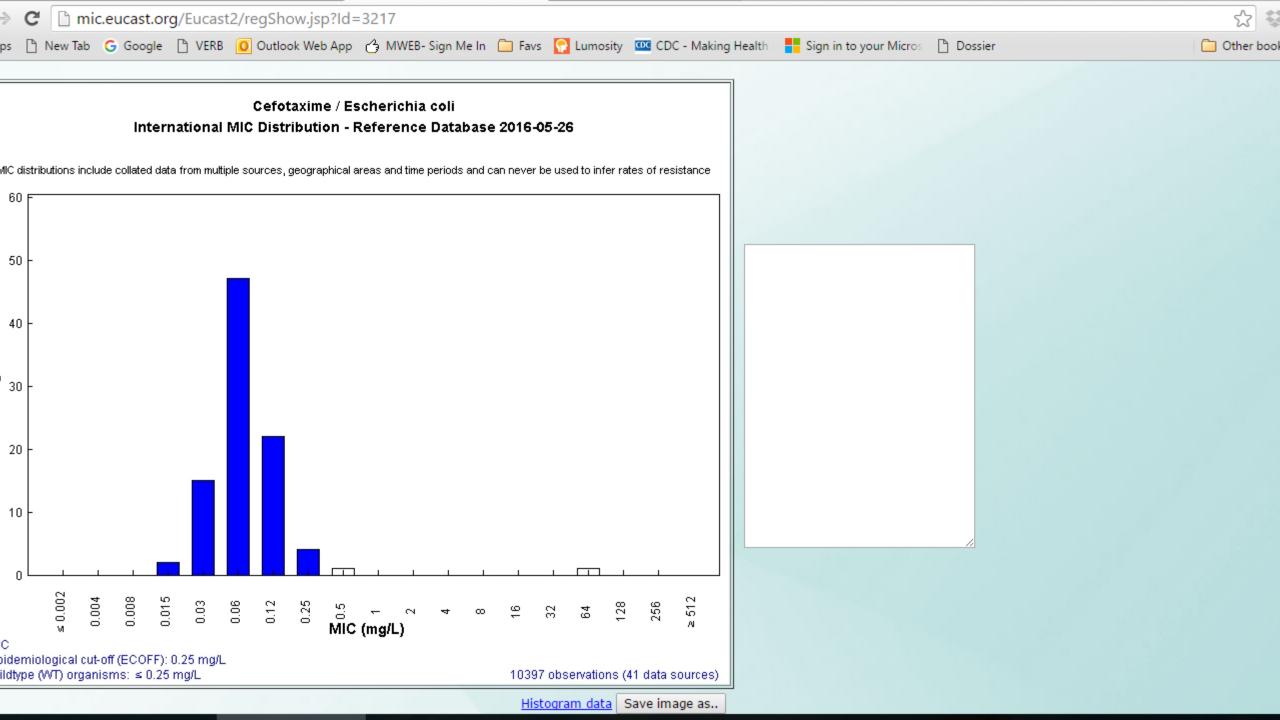

ESBL

MIC data

- 1. Cefotaxime ECOFF*: 0.25μg/ml
- 2. Ceftriaxone ECOFF*: 0.125μg/ml
- 3. Ceftazidime ECOFF*: 0.5µg/ml
- 4. Cefepime ECOFF*: 0.125μg/ml
- 5. Aztreonam ECOFF†: 0.25μg/ml
- 6. Piperacillin-tazobactam ECOFF*: 8μg/ml

INCREMENT - Study design

- 1. Multinational, retrospective cohort study.
- 2. Registered Clinicaltrials.gov: NCT01764490
- 3. Reported according to STROBE guidelines
- 4. Patients with monomicrobial BSI due to ESBL-E or CPE
- 5. Monotherapy:
 - BLBLI or carbapenem (any)
- 6. Outcomes:
 - 14-day clinical cure/response rate
 - 30-day all-cause mortality
- 7. Analysis: statistically sound

AOR for outcomes

	Empirical	Targeted	Global cohort

Favors Carbap. Favors BLBLI

ESBL - EUCAST vs CLSI

ZONES MICs

Cephalosporins	EUCAST	CLSI	EUCAST	CLSI	
Cefepime	24/21	25/18	1/4	2/16	CLSI: No intermediate but a S-DD
Cefotaxime	20/17	23/19	1/2	1/4	CLSI: ceftriaxone = or
Cefoxitin	19/19	18/14	NA	3/32	EUCAST: cefoxitin is a screen (ECOFF high sens but poor spec for AmpC)
Ceftazidime	22/19	21/17	1/4	4/16	

Piperacillin-	20/17	21/17	16/8	128/16	Disc content: different
tazobactam					CLSI: 100_10µg
					EUCAST: 30_6μg

ESBL – How to report...

- 1. Interpretive rules as per EUCAST is to report as is for oxyiminocephs and BLBLI.
- 2. Important caveats here:
 - 1. CLSI vs EUCAST CBP
 - 2. Testing modality being used
 - 3. Dosing optimized

AmpC

EUCAST position

"Discourages use of cefotaxime, ceftriaxone or ceftazidime in *E. cloacae* (A), *C. freundii, M. morganii & Serratia spp* (B), because of risk of selection for resistance"

AmpC - MIC data

- 1. ECOFFs:
 - 1. *E. cloacae*: 0.5μg/ml
 - 2. Rest = ND

Link to EUCAST MIC tables

AmpC – the nuts and bolts

- 1. AmpC = Bush-Jacoby 1/1e
- 2. By definition "greater hydrolysis of cephs than benzylpenicillin; hydrolysis of cephamycins.
- 3. No inhibition by clavulanic acid and/or tazobactam
- 4. ACT/CMY/FOX/MIR: have different affinities for different antimicrobials.
- 5. Inducibility: dependent on the ß-lactam (strong vs weak inducers)

AmpC – EUCAST rule 9.2

9.2 Selection of AmpC-derepressed Cefotaxime, ceftriaxone, Cefotaxime, ceftriaxone, IF susceptible in vitro to cefotaxime, Enterobacter ceftriaxone or ceftazidime, THEN note spp., Citrobacter and ceftazidime and ceftazidime cephalosporin-resistant mutants may freundii, Serratia that the use in monotherapy of occur during therapy. The use of a cefotaxime, ceftriaxone or ceftazidime third-generation cephalosporin in spp., and combination with an aminoglycoside Morganella should be discouraged, owing to the may also lead to failure by selection of risk of selecting resistance, or suppress morganii the susceptibility testing results for resistant mutants. Combination with quinolones has, however, been found these agents to be protective. The selection risk is absent or much diminished for

Enterobacter spp graded A, others graded B evidence. Reference is the Chow study.

cefepime and cefpirome

Chow landmark study

- 1. 1991 prospective observational study
- 2. 6 centres collected consecutive *Enterobacter* isolates from blood over a period of 18 months
- 3. 129 patients in total; 118 received appropriate empiric Rx; 11 (9%) isolated a 2nd R isolate.
- 4. 7 patients (6%) had identical isolates = emergence of resistance
- 5. 6 patients (5%) had cephalosporin resistance
- **6.** <u>19%</u> (6/31) emergence of resistance following 3GC Rx.

Considerations...

Table 3. Emergence of Resistance during Antibiotic Therapy for Enterobacter Bacteremia*

Patient	Antibiotics Used	Emergence of Resistance to Drug	MIC MIC before after Therapy Therapy		Duration of Therapy when Resistance Was Seen	Source of Second Positive Culture	Enterobacter spp.	Outcome	
			μg/	mL	d				
1	Cefotaxime	Cefotaxime	≤ 4	> 32	16	Intra-abdominal abscess	E. cloacae	Survived	
2	Ceftazidime, tobramycin	Ceftazidime	≤ 2	> 16	18	Blood	E. cloacae	Survived	
3	Ceftazidime, gentamicin	Ceftazidime	≤ 2	> 16	5	Blood	E. cloacae	Survived	
4	Cefotaxime, amikacin	Cefotaxime	≤ 4	> 32	6	Blood	E. aerogenes	Died	
5	Ceftizoxime	Ceftizoxime	8	32	4	Blood	E. cloacae	Survived	
6	Cefotaxime, gentamicin	Cefotaxime	8	32	7	Blood	E. aerogenes	Survived	
7	Piperacillin, tobramycin	Tobramycin	≤ 0.25	8	8	Two central venous catheters	E. cloacae	Survived	

^{*} MIC = minimal inhibitory concentration.

Our most important finding was that administration of a third-generation cephalosporin within 14 days of Enterobacter bacteremia was more likely to be associated with a multiresistant Enterobacter sp. in the initial positive blood culture (P < 0.001, Table 2). This finding

AmpC – How to report...

- 1. The case for suppression or changing susceptible to resistant is weak (*Enterobacter* spp > others).
- 2. As per EUCAST, **DO NOT** modify but rather add a comment.

Thank you
